

State Machine Question (100 marks)

Given the problem description below, specify the **state machine** for the Thermomix® TM6 kitchen appliance. **Show the states as well as transitions including events, guards, and actions.** You do **not** need to specify parameters for events, guards, and actions. If you use private methods for guards or actions in your state machine, use **meaningful** names for those methods. You do **not** need to define the method bodies of those methods.

An alternative solution is to model the Selector with states Idle and PreparingOff as a parallel region of the On state. The initial pseudo state is attached to the Idle state. selectorHeld transitions from Idle to PreparingOff and selectorReleased from PreparingOff to Idle. The transition “after 5sec” goes from PreparingOff to Off. This replaces the PreparingOff and History states in the above solution.
